Deleting Blank Rows in Excel

1. Select column with blank cells.

2. Hit F5 on your keyboard, which will bring up the “Go To” window. Click on “Special”.
3. From the “Go To Special” window be sure to select “Blanks”. Then click Ok.

4. All blank cells within that column are now selected. From here you can tell it to delete the cells, and when prompted select “Entire Row”. Click Ok and it will delete your blank rows.

*Note* These instructions are for Microsoft Excel 2010, but if you can find the “Go To” window, which I believe would be under the Edit menu, then the instructions should be very similar.
